TN02626 Contact Heat Element Installation Instructions

TE02626 ON CONTINENTAL
-520 & -550 CYLINDER

TAS76 ON CONTINENTAL -360 CYLINDER

TAS76 ON LYCOMING ENGINE

The TE02626 contact (block) heat element is designed for installation on Continental -360 & -520, -550 engines with split rocker covers and on most Lycoming engines.

It is recommended that a thin layer of AC-1230 Tanis bonding sealant be used between the mounting surfaces and on the bolt for proper heat transfer.

For Continental -360 and some -550 engines an aluminum washer is included that may be needed between the baffle mount tab and the TAS76 element. The raised casting around the baffle mount tab may separate the element away from the cylinder head reducing heat transfer.

A "star" washer is included to be installed under the bolt head.

Install element, route leads and clamp per instructions supplied with the preheater kit and in accordance with AC43.13-1B.

The TE02626 is a 50 WATT heat element with approximate resistance readings of 265 ohms (115V), 1058 ohms (230V).
