Instruction TN02628
TT02628 Threaded Heat Element

The TT02628 heated bolts are designed for installation in the thermocouple well on TCM Continental and Lycoming cylinders. It is similar to the TAS100.

TT02628 Cylinder Heater
(50 Watts, 115 or 230 Volts)
(100 Watts, 115 or 230 Volts)

Comes with anti-seize.

Install the TT02628 element in in the cylinder head thermocouple well using the anti-seize compound included with the element. Torque the element to engine manufacturer's specification (approximately 25-35 inch pounds). When the proper torque is reached, the wrenching flats might not contact the cylinder head. Use caution not to flex the power leads more than is necessary as they may break away from the heating element.

Tie wrap the element leads to an intake tube elbow or push rod tube. Or, secure in another manner to minimize vibration of the leads. Do not tie the leads to an engine mount.
